The invention relates to a subto. Intertering increase acta (SLAIM) moderate that down-regulates expression of a hepatitis B virus (HBV) gene by RNA interference or that inhibits HBV replication. Also disclosed are the interference or that inhibits HBV replication. Also disclosed are the collowing: (i) a method of generating a library of a HBV gene in a collowing; (i) a method of generating a library of alMA constructs considered complexity; (iii) a cell containing one or more sinh molecules; (iv) a kit containing a sinh molecule which can be used to complement the expression of a HBV target gene in a cell; tissue or complement is adapted for use to treat HBV infection, and comprises a sense complementary to an RNA sequence encoding HBV and the sense region. Where the antisense region comprises sequence complementary to the antisense region comprises the sense region and the second fragment comprises the sense region and the second fragment comprises the comprises the sense region and the second fragment comprises the antisense region ond the sold fragment comprises a 3'-terminal commected via a linker molecule. The linker molecule is a polynucleotide. Comprises region on the antisense region comprises a 3'-terminal overhang and the antisense region of the sink molecule for comprises a 3'-terminal coverhang and the antisense region of the sink is useful for treating human hepatitis B virus controlled and for characterising pathways of gene function, e.g. to inhibit activity of target genes in a pathway to determine the function comprises and/or research settings. The plant perpendence represents 1 of 1504 HBV and/or research settings. The present sequence represents 1 of 1504 HBV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

The invention relates to a short interfering nucleic acid (siNA) molecule that down-regulates expression of a hepatitis B virus (HBV) gene by RNA interferance or that inhibite HW replication. Also disclosed are the following: (i) a method of modulating the expression of a HBV gene in a tiseus explant; (ii) a method of modulating the expression of a HBV gene in a classification or more sinal molecules; (iv) a kit containing a siNA molecule which can be used to modulate the expression of a HBV target gene in a cell, tissue or coganism; and (v) a method for synthesising a siNA molecule. The siNA molecule is adapted for use to treat HBV infection, and comprises a sense and an antisense region, where the antisense region comprises sequence complementary to the antisense region comprises sequence complementary to the antisense region of the siNA acquence encoding HBV and the sense region comprises the sense region and the actisense region of the siNA molecule. The siNA molecule is assembled from 2 nucleic acid fragment comprises the sense region and the second fragment comprises the sense region and the second fragment comprises the antisense region of the siNA molecule. The linker molecule is a polynucleotides. Inker and a linker molecule. The linker molecule is a polynucleotides. Comprises ergion of the antisense region comprise separate oligonucleotides, and are covalently coverhang. The 3'-terminal overhang seach comprises a 3'-terminal overhang and the antisense region comprises a 3'-terminal coverhang and the antisense region ocomprises and or the function of uncharacterised genes in a pathway to determine the function of uncharacterised genes in a pathway to determine the function and/or separate fluction and ysis. The sink molecule and or the invention gene function analysis. The sink molecule in a pathway to determine the function and/or research setting or pare function and particle may also be used in clinical, industrial, envivormental, and inclinical, industrial, envivormental, and particule of the inven
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human HER1 (EGFR) transcript target sequence/siNA upper strand, SEQ:569.
                                                                                                                                                                                                                                                                                                                                                      New short interfering nucleic acid molecules which down-regulates expression of a hepatitis B virus (HBV) or which inhibits HBV replication, useful for treating human HBV infections or for characterizing gene function:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 14.8; DB 1; Length 19;

The invention relates to short interfering nucleic acids (sink) which downregulate expression of one or more human epidermal growth factor computation (sink) genes (including HERA) HERA and HERA) by RNA interference. The sinks may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an antisense oligonuclectide. Specifically, the sinks include short interfering RNA (shrNA), double-stranded RNA, micro-RNA (mirNA) and short interfering RNA (shrNA), The sinks can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, cand/or complexes of sink) and vectors that express sink, conjugates and overtice that express sink. The sinks are used to modulate expression of EGFK genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants or treating a wide range of cancers such as breast and ovarian cancer. The catering a wide range of cancers such as breast and ovarian cancer. The sinks are also useful for drug screening, diagnosis, therapeutic target confidenticion, and gene mapping (e.g., of single nucleotide contains and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide contains the upper strand of a them when HERI (EGFR)-targeted double-etranded sink, which is identical to New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of the epidermal growth RNA interference; short interfering nucleic acid; siNA; short interfering RNA; slRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; cancer; cytostatic; human; oncogene; epidermal growth factor receptor; EGFR; Fosnaugh K, Jamison S; Example 3; SEQ ID NO 569; 171pp; English. downregulate expression of one or more human epidermal growth factor receptor (BGFR) genes (including HER1, HER2 HER3 and HER4) by RNA interference. The sinks may or may not comprise stand HER4) by RNA interference. The sinks may or may not comprise sense and many be double or single stranded. They further comprise sense and matisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the sinks include short interfering RNA (sirkNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (sirkNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (sirkNA). The siNAs can be unmodified or chemically modified, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of EGER genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants correcting a wide range of cancers such as breast and ovarian cancer. The siNAs are also useful for drug screening, diagnosis, therapeutic target

Human KDR VEGF receptor hammerhead ribozyme substrate #73

28-JUL-1999 (first entry)

AAX71061;

95

```
The invention describes a new isolated polypeptide (I) comprises a fully defined sequence of, a mature form, one or more conservative substitutions or at least 95% identity to 158 amino acids SEQ ID NO: 2n as given in the specification, where n is an integer between 1-33. The novel proteins of the invention are members of the following families: novel proteins of the invention are members of the following families: 210038H17RK membrane (TmSP) proteins; sorting nexin 6-like proteins; 2110038H17RK membrane (TmSP) proteins; LRP16 proteins; 57345109RK cyclin-like proteins; phosphatidylethanolamine-biniding protein: Like proteins; cimmunoglobulin-like LRR-domain containing protein: LRP16 proteins; cimmunoglobulin-like LRR-domain containing proteins; NUMB binding protein alpha-like proteins; actin-binding protein: Anyps0-like proteins; actin-binding protein; related proteins; actin-binding protein; habit alpha-like proteins; chemicallular carcinoma autoantigen-like proteins; raph-delta-like proteins; chemicallular carcinoma autoantigen-like proteins; raph-delta-like proteins; and tumour protein p53-binding protein 2-like proteins; chemicallular carcinoms of sequence containing protein 130-like proteins; and tumour protein p53-binding protein 2-like proteins; chemicallular carcinoms of disorders associated with aberrant expression or activity of the NoVX polypeptide, such as cancer, diabetes, obesity, and endocrine. CNS and inflammatory disorders. They can also be used in chance and endocrine. CNS and inflammatory disorders. They can also be used in chance and endocrine. CNS and inflammatory disorders. They can also be used in chance and endocrine. This sequence represents a probe used in the containing assays, chromosome mapping, tissue typing and predictive medicine. This sequence represents a probe used in the containing and predictive medicine in the novel human polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                               Alsobrook JP, Burgess CE, Catterton E, Chant JS, Chaudhuri A;

synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VGGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (Lit-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogeneeis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                 Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes nucleic acid molecules which modulate the

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cregulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids and inclaims of a neurite growth inhibitor gene (NGGO). The nucleic acids and no possessing and with a NRM molecule possessing an NCH motifi), a G-cleaver (cleaving RNA with a NRM motif) a G-cleaver (cleaving RNA with a NRM motif) proposessing an NCH motifi) a G-cleaver (cleaving RNA with a NRM motifi) and a memberzyme (cleaving RNA with a NRM think in NRM motifi) and a memberzyme (cleaving RNA with a NRM think in NRM motifi) and the presence of a divalent cation that is preferably MG<sup>22</sup>+.

Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more theory in particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-flowdgwin's lymphoma (NRL), bulky low-grade or follicular NRL, lymphocytic luckaemia, HLV (human immunodeficiency virus) associated NRL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCC). The treatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of NGC. The treatment may further comprise the use of one or more clear and the more system (CNA) stroke), Alzaheimer's disease, demential, multiple sclerosis (MS), chemotherapy-induced neuropath
Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Seguence 17 BP; 2 A; 6 C; 1 G; 0 T; 8 U; 0 Other;

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acids (e.g. a ribozyme or a DNAzyme) an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) prossessing an NCH motif), a G-cleaver (cleaving RNA with a NGN triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further compities the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to

treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
Leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
Immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-
targetting nucleic acid is used to cleave RNA.of the NOGO gene in the
presence of a divalent cation that is preferably MG'2+. Furthermore, the
nucleic acid may be contacted with a cell to reduce NOGO activity of the
cell and treat a patient having a condition associated with the level of
NOGO. The treatment may further comprise the use of one or more
therapies. In particular, the NOGO-targetting nucleic acid may be used to
treat central nervous system (CNS) injury and cerebrovascular accident
CCVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS),
chemotherapy-induced neuropathy, anyotrophic lateral sclerosis (ALS),
parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
disease, muscular dystrophy, and/or other neurodegenerative disease
                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 protein substrates, to hGDMLP-1 protein substrates, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunospens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The protein sequence expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô
                         New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaрв

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 (an be used in gene therapy and vaccine production. The hGDMLP-1 mucleic acids in gene therapy and vaccine production. The hGDMLP-1 concleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therappentic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The collised associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 may be used for diagnosing a disorders hGDMLP-1 is localised to chromosome 22.

The present sequence in the exemplification of the present invention. N.B. The sequence of this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO capture in for the present directly from wire construction and production of the present directly from wire construction and production of the present directly from wire construction and production of the present directly from wire construction and production of the present directly from wire construction and production of the present directly from wire construction and selectronic format directly from wire construction and selection of
                                                                                                                                                                                                                                                                                                                                                                         New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                        Hanzel DK, Rank DR,

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 mucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 mucleic acids in samples, as amplification substrates, to hGDMLP-1 mucleic acids in samples, as amplification substrates, to hGDMLP-1 proteins unprovements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be expressing the proteins. The hGDMLP-1 proteins or polypeptides may be capture probes for surface-enhanced laser description ionisation, and in vaccines or for hGDMLP-1 may be used for diagnosing a therapeutic supplement in patients having specifically in GDMLP-1 proteins, and standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule captures probes for surface-enhanced laser description ionisation, as therefore an unique to the hard or replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The consumption of his present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B.

The sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence in the supplication, but was obtained in electronic format directly from WIPO

protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunospens to raise antibodies that specifically recognise hGDMLP-1 proteins, as sendards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therefore the paving specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concentration and skeletal muscle disorders encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP capture probes for surface-enhanced laser desorption ionisation, and or amount specifically of hGDMLP proteins, as specific biomolacule capture probes for surface-enhanced laser desorption ionisation, as production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concentration of shother associated with the expression of hGDMLP-1 may be used for diagnosing a clisorder associated with the expression of hGDMLP-1. Sequence in the exemplification of the present sequence and for this patent did not form part of the printed captured but was obtained in electronic format directly from WIPO capture there in the present did not form part of the printed captured production, but was obtained in electronic format directly from WIPO captured production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; SEQ ID NO 6629; 214pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 8 % identity to the 17 mer sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying and/or amplifying a nucleic acid, e.g. as one promognent of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral
                               therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleocide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel isolated 17 mer nucleic acid sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
probes for surface-enhanced laser desorption ionisation, as

                                                                                                                                                   ö
diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for disgnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymoration sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus infection.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HFV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes. DNAzymes, inczymes, zinzymes, and G-cleaver ribozymes. DNAzymes, inczymes, zinzymes, and G-cleaver ribozymes. DNAzymes, concerning and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonuclectides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV cycles and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV interfined in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or the synthesis, expression and/or stability of Hepatitis C virus (HCV) or and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, or inozymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV CC ompounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds compunds of the invention are useful for the treatment of degenerative and methods of the invention are useful for the treatment of degenerative and especial sease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular expression such as cirrhosis, liver failure, and hepatocellular expression such as cirrhosis, liver failure, and hepatocellular expression expressed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                          Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus

                                              Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatities C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (WEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (fll-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the parient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                 Jascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1;
     the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                               KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesie; psoriasie; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; focetal liver kinase 1; sa

oligonucleotides AAX22276-532 represent PCR primers and probes used to isolate and amplify CDNA encoding secreted and transmembrane human proteins (see AAX52213-74 and AAX13344-403). The CDNA sequences are obtained from CDNA libraries, prepared from fetal lung, fetal kidney, fetal brain, fetal liver and fetal retina. The encoded polypeptides have specific uses based on their homology to known polypeptides, e.g. PR0211 and PR0217 can be used for disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and correct mucosal lesions (e.g. enterocolitis, 2011inger-Ellison syndrome, cg gastrointestinal ulceration and compenital microvillus atrophy), skin diseases associated with abnormal keratinocyte differentiation (e.g. vulva and gliomas), potent effects on cell growth and development, diseases related to growth or survival of nerve cells including CC PR0265 can be used as for fibromodulin, e.g. for reducing dermal cc scarring. PR0264 can be used as a target for anti-tumor drugs. PR0533 may comed as a parafet. Decore of Altrophysia areata; PR0269 can be used as a strict proper and proper an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   be used as an anti-thrombotic agent; PRO287 polypetides and portions may have therapeutic applications in wound healing and tissue repair; PRO317 can be used for treating problems of the kidney, uterus, endometrium, blood vessels, or related tissue, e.g. in the heart of genital tract
                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated human genes and polypeptides used in, e.g. treatment gastrointestinal ulceration.

```
A55757) which are targeted to nucleic acids encoding a human tumour necrosis factor receptor-associated factor (TRAF). The antisense sequences comprise at least one modified internucleotide linkage, which is a phosphorothicate linkage. The oligonicleotides also include at least one modified sugar moiety such as a 2'-O-methoxyethyl sugar moiety. Sequences AAA55490-A55495 represent nucleotide sequences encoding human TRAFI-6. Included in the invention is a method for treating a human daministering an antisense oligonucleotide. The reduction of jun kinase activation in cells comprises contacting the cells with an antisense oligonucleotide cells with an antisense oligonucleotide to the reduction of E-
                                                                                                                                                                          Antisense oligonucleotides targeted to nucleic acids encoding human tumor necrosis factor receptor-associated factor (TRAF), useful for treating diseases associated with TRAF expression such as inflammatory diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    selectin expression in cells or tissues comprises contacting the cells or tissues with an antisense oligonucleotide targeted to TRAF-2 or TRAF-6. The antisense oligonucleotides have antiproliferative and anti-inflammatory activity and are useful for treating disorders associated with cell proliferation and inflammation. The antisense oligonucleotides may also be used as a diagnostic probe for studying gene function
                                                                                                                                                                                                                                                                                       present invention relates to antisense oligonucleotides (see AAA55496

The present invention relates to antisense oligonucleotides (see AAA55496
-A55757) which are targeted to nucleic acids encoding a human tumour
necrosis factor receptor-associated factor (TRAP). The antisense
sequences comprise at least one modified internucleotide linkage, which
is a phosphorothioate linkage. The oligonucleotides also include at least
one modified sugar moiety such as a 2 -O methoxyethyl sugar moiety.
Sequences AAA55490-A55495 represent nucleotide squences encoding human
TRAF1-6. Included in the invention is a method for treating a human
having a disease associated with the expression of TRAP comprising
administering an antisense oligonucleotide. The reduction of jun kinase
activation in cells comprises contacting the cells with an antisense
oligonucleotide targeted to TRAF-6. A method for the reduction of E-
selectin expression in cells or tissues contacting the cells or
tissues with an antisense oligonucleotide targeted to TRAF-2 or TRAF-6.
The antisense oligonucleotides have antiproliferative and anti-
inflammatory activity and are useful for treating disorders associated
with call proliferation and inflammation. The antisense oligonucleotides
with call proliferation and inflammation. The antisense oligonucleotides
with call proliferation and antileanse oligonucleotides
with call proliferation and antileanse oligonucleotides
with call proliferation and antileanse oligonucleotides
with call proliferation and sufflammation. The antisense oligonucleotides
with call proliferation and sufflammation of the call of the call proliferation and sufflammation of the call of the call

                                                                                                                                                                   The invention relates to a novel nucleic acid encoding a PRO polypeptide. The polypeptides and polynucleotides of the invention may be useful as research tools and as therapeutics for treating enterocolitis, Zollinger-Ellison syndrome, gastrointestinal ulceration, psoriasis, zollinger-Parkinson's disease, Alzheimer's disease, ALS, neuropathies, dermal scarring and wound healing, nerve repair, thromboass, bone and/or cartilage formation, angiogenesis, asthma, rheumatoid arthritis, multiple sclerosis, inflammatory disorders, atherosclerosis, cardiac injury, infertility, premature aging, AIDS, diabetes complications and stroke. The molecules may also be utilised during gene therapy procedures and transgenic animal production. The current sequence is that of the PCR primer of the invention which was used to analyse the human PRO DNA of
                                                                                        Novel nucleic acids encoding secreted and transmembrane polypeptides with homology, e.g. to growth and cancer-associated antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, PRO; dermatological; antipsoriatic; cytostatic; antiinflammatory; antiparkinsonian nootropic; neuroprotective; vulnerary; cardiant; antiangoganic; vasotropic; antisthmatic; antiheumatic; cancer; antiarthritic; antinfertility; antidabetic; antiviral; diabetes; ophthalmological; gene therapy; skin disease; gastrointestinal disorder; ischaemia; inflammation; PCR primer; ss.

Sixty one nucleic acids encoding PRO polypeptides which are useful in the treatment of skin diseases (e.g. psoriasis), cancers (e.g. lung squamous cell carcinoma) and neurodegenerative diseases (e.g. Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a primer which was used in the isolation of one of sixty one nucleic acids encoding novel secreted and transmembrane PRO pypetides. The PRO polypeptides are useful for treating skin diseases (e.g. psoriasis), cancers (e.g. lung squamous cell carcinoma), experianal disorders (e.g. entercoclitis), neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson's disease), wound repair, eardiovascular disorders (e.g. entencoclitis) lededing angiogenesis, ischaemias such as coronary ischaemia, atherosclerosis), inflammatory disorders (e.g. asthma, rheumatoid arthritis, multiple sclerosis), inflammatory infertility, AIDS and diabetes and retinal disorders such as retinitis pigmentosum. The PRO nucleic acids have applications in molecular biology, including use as hybridization probes, and in chromosome and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Haematopoietic cell proliferation disorder related oligonucleotide #1086.

The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. ABZ09861 to ABZ18118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute lymphocytic leukaemia and acute myelogenous leukaemia; as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related bus and their complements; and as primers for the amplification of haematopoietic cell proliferation between aucle caused for detecting a predisposition to, differentiation between subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferative disorder: method enables a highly specific classification of haematopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders. The present method enables disorders allowing for improved and informed treatment of patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides.

New isolated PRO polypeptides e.g. PRO211, PRO217 and PRO230, useful for treating Parkinson's disease, Alzheimer's disease, amyotropic lateral sclerosis, cancer, neuropathies and psoriasis.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodises that specifically bind to the PRO polypeptide. For linking a bloadcaive molecule to a cell expressing a PRO polypeptides are useful for detecting other PRO polypeptides are useful for modulating the biological activity of a cell. PRO polypeptides are useful for modulating the biological activity of polypeptide are useful for modulating placed or linking a bioaccive molecule to a cell expressing a PRO polypeptides. The PRO polypeptides or polypeptide activity of a cell expressing spreadly a pharmaceuticals, diagnostics biosensors or polymetride antibodies are useful for modulating hypertrophy of neonatal heart. inhibiting vaccular endothelial growth factor (VEGF) stimulated continuating vaccular endothelial growth factor (VEGF) stimulated continuating vaccular endothelial growth factor (VEGF) stimulated continuating dlucose or FFA uptake, inducing or proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of chondrocytes. In particular, these are useful for cells, modulating glucose or FFA uptake, inducing or offset in endothelial colls, inducing or forsity and activation of solutions of solutions of contropy. Aiabetes, hyperinaulinaemia, or bone or cartilage disorders, wounds, cretinitis plamentosum), obesity, diabetes, hyperinaulinaemia, or bone or cartilage disorders (e.g. sports injuries or thinking to induce the full-length profice or of sense which have a role in cell data. The polymucian probes for control of sense which have a role in cell death, the preparing PRO polypeptides, for generating reasons. Control of therapeutically useful reagents, as probes and for the control of therapeutically useful reagents, as probes and for the economianally expressing the protein and gene mapping, in the generation of the economiantly expressing the protein and gene

                                                                                                                                                                                           12-NOV-1
                                                                                                                                                                                                                                                          24-NOV-1
    ö
useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a DNA probe which was used to detect a PRO polynucleotide of the invention. NOTE: This sequence is described as SEQ ID NO 239 in Example 38 of the disclosure but is different from SEQ ID NO 239 represented in the Sequence Listing.

97US-0065186P 20-MAY-2004 (first entry) US2003054349-A1. Homo sapiens. 20-MAR-2003 17-SEP-1997 17-NOV-1997 17-0CT-1997 17-0CT-1997 21-OCT-1997 ADJ26590; 28-OCT-1 28-OCT-1 29-OCT-1 1-0CT-1 12-NOV-1 24-OCT-24-OCT-7-0CT-27-OCT-3-OCT-29-OCT-03-NOV-07-NOV-28-OCT-39-OCT-29-OCT-The invention discloses isolated PRO secreted/transmembrane polypeptides can antibodias that specifically bind to the PRO polypeptides can be used to raise antibodias that specifically bind to the PRO polypeptide to raise antibodias that specifically bind to the PRO polypeptide. The PRO polypeptide are useful activity of a cell expressing a PRO polypeptide. The PRO polypeptide are useful activity of a cell expressing a PRO polypeptide. The PRO polypeptide are useful activity of a cell expressing a PRO polypeptide are useful as pharaceutical, diagnostics biological activity of a cell expressing a PRO polypeptide. The PRO polypeptide are useful as pharaceutical, diagnostics, blosensors or blosensors or cell expressing the proliferation of carcinal neurons or rod photoreceptor cells, inducing proliferation of endochelial cells, modulating the proliferation of endochelial cells, modulating the proliferation of carcinal neurons or rod photoreceptor cells, inducing proliferation of carcinal particular these are useful for the cells, modulating to train a cardioc insurance or read processor or read particular bear are useful for carcinal pages or read particular bear are useful and sorders wounds, cancerus celliferantiation of chondrocytes. In particular these are useful for carcinatis pigmentosum) obesity, diaberes wperstandial disorders or injuries (carcinatis pigmentosum) obesity, diaberes when the polymuciscities expression of genes which have a role in cell death. The polymuciscities expression of genes which have a role in cell death. The polymuciscities or recinitis pigmentosum) obesity, planetes, for generating transgenic are useful in modular blodogy including uses as hybridiazing or the processum and gene mapping) in the generating transgenic connent and page and process are useful and page and process are useful and page and process and processes as therapeutic agency including uses as hybridiazing which are useful and processes are useful and for chromosome and gene mapping, pro and pages of processes are ö Novel isolated native PRO polypeptide useful for treating Parkinson's disease, enterocolitis, Zollinger-Ellison syndrome gastrointestinal ulceration, Alzheimer's disease, amyotrophic lateral sclerosis, Usher 1467 CAGCCTGTACTGCCAG 1482 3 cagcardracrdccag 18

Novel isolated native PRO polypeptide useful for tissue typing, modulating biological activity of cell, as molecular weight markers in protein electrophoresis, for treating enterocolitis, Zollinger-Ellison

# Example 38; Page 111; 483pp; English.

syndrome.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the mucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a call expressing a PRO potein and for modulating at least one biological activity of a cell. PRO polypeptides are useful bioactive molecule to a call expressing a PRO polypeptide and for linking a bioactive molecule to a call expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are useful for stimulating hypertrophy of neonatal

cc terminated vaccular endothelial growth factor (VBGF)-stimulated stimulated composition of endothelial cells, modulating the proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of compositions or rod photoreceptor cells, inducing proliferation of cells, modulating glucose or FFA uptake, inducing proliferation of composition of chondrocytes. In particular, these are useful for detecting or treating glucose or FFA uptake, inducing proliferation and/or rediffication of chondrocytes. In particular, these are useful for detecting or treating cardiac insufficiency disorders, wounds, cancerous cumours, retinal disorders or injuries (e.g. loss of sight due to retinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or retinitis) in mammals. PRO polypeptides and their portions affect the architectul in melecular biology including uses as hybridisation probes or condomners, in chromosome and gene mapping, in the generation of antisense RNA arc useful in molecular biology including uses as hybridisation probes or condomners. An or process and DNA, for preparing PRO polypeptides, for generation of antisense RNA animals or knockout animals which are useful in the development and or chromosome identification.

CC Greening of therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for recombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify the propagation in specific cells are useful for succendinate (an ensemble and protein and for chromosome is succenting compounds to identify the purposes are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, itsues or serum and for affinity of entering any also be used in gene therapy, particularly for replacing a detect a PRO Polyperide of the inv Sequence 18 BP; 4 A; 7 C; 4 G; 3 T; 0 U; 0 Other;

13-NOV-2003.

The invention discloses isolated PRO secreted/transmembrane polypeptides can define nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptides are beed to raise antibodies that specifically bind to the PRO polypeptide are useful to consider the properties are useful to consider the properties are useful and properties are useful specification of the properties are useful as phasmaceucial, diagnostics bissensors of polymortocotides are useful as phasmaceucial, diadnostics of stimulated T-lymphocytes, enhancing the survival or proliferation of endichelial cells, modulating the proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of stimulated T-lymphocytes or PRA putake, inducing proliferation of stimulated T-lymphocytes or PRA putake, inducing proliferation of stimulating places or rod photocytes. In particular, these are useful for detecting or treating cardiac insufficiency disorders, wounds, cancerous chingtentiating of chondrocytes. In particular, these are useful for detecting or treating cardiac insufficiency disorders, whereinsulinaemia, or bone or cartilage disorders, whereinsulinaemia or bone or cartilage disorders as upports in the propertions are entitits pigmentosum, obesity, properties et ag sports injuries or arthitis or knockout animals which are useful as probes and constraints and their portions as probes for constitution of genes which have a propertied and their portions are leaful as moderular manals which are useful in the development of processes as therapeutic agents, to purposes, as therapeutically useful respective or protein are useful a manals p New PRO polypeptide for preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody, e.g. inflammatory diseases, cancer or acquired immunodeficiency syndrome. , Botstein D, Desnoyers L, Eaton DL, F. New isolated native PRO polypeptide useful for treating Parkinson's disease, enterocolitis, Zollinger-Ellison syndrome gastrointestinal ulceration, Alzheimer's disease, amyotrophic lateral sclerosis, or Usher

# Example 38; Page 99; 469pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a

bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. RPO polypeptides are useful cor detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptides are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or bioactive molecule to a cell expressing PRO polypeptides. The PRO polypeptides or bioreactors. Disease are useful for stimulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or bioreactors. These are useful for stimulating the proliferation of a chadchelial cells, inducing proliferation of endothelial cells, inducing proliferation of cells, modulating proliferation of endothelial cells, inducing proliferation of cells, modulating proliferation and/or redifferentiation of chondrocytes, newticular, these are useful for detecting or treating cardiac insufficiency disorders, wounds, cancerous cells, modulating glucose or FRA upcase, inducing proliferation and/or redifferentiation of chondrocytes. In particular, these are useful for detecting or treating cardiac insufficiency disorders, wounds, cancerous cells, modulating procession of chondrocytes in particular, these are useful for carticular polymolectics or capturities programs affect the expression of genes which have a role in cell death. The polymolectics or companion of pages which have a role in cell death. The polymolectics or companion of properties and publy for preparing PRO polypeptides and their portions affect of control DNA, in chromosome and gene mapping, in the generation of antisense RNA and DNA, for preparing PRO polypeptides, for generation of antisense CCC companion of the properties are useful in which are useful in the development of carting transgenic animals or knockut animals which are useful in the genetic as are useful for a seasy for PRO e.g. detecting its expression in specific cells, tissues or serum and for throadcas ; 0 Human; PCR; primer; ss; PRO; secreted; transmembrane; therapeutic; tissue typing; immunohistochemical staining; gene therapy; nenonatal heart; vascular endothelial growth factor; VEGF; proliferation; endothelial cell; stimulated '1-lymphocyte; retinal neuron; rod photoreceptor cell; c-fos; glucose; FFA; chondrocyte; cardiac insufficiency disorder; wound; cancer; tumour; retinal disorder; retinits pigmentosum; obesity; diabete; hyperinsulinaemia; hypoinsulinaemia; bone disorder; cartilage disorder; sport injury; arthritis; cardiant; vulnerary; cytostatic; ophthalmological; Gaps ; 0 0.9%; Score 14.4; DB 1; Length 18; 93.8%; Pred. The invention discloses isolated PRO secreted/transmembrane polypeptides and the nuclear caid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloacative molecule to a cell expressing a PRO polypeptide, for linking a bloacative molecule to a cell expressing a PRO polypeptide are useful concerned and for modulating a cat least one biological activity of a cell. PRO polypeptides are useful concerned and polypeptides or polypeptides are useful for modulating the biological activity of a cell expressing a PRO polypeptides. The PRO polypeptides or polypeptide are useful for modulating the biological activity of a cell expressing a PRO polypeptide. The PRO polypeptides or polymented or these are useful for stimulating uppertrophy of monatal proliferation of endothelial cells, modulating the proliferation of condroverse enhancing the survival or proliferation of condroverse enhancing the survival or proliferation of condroverse enhancing the survival or proliferation of condroverse or particular, these are useful for cells, modulating glucose or FPA uptake, inducing proliferation of condroverse or particular, these are useful for cental neurons or road photoreceptor cells, inducing proliferation of condroverse or particular, these are useful for cental and condroverse. In particular, these are useful for certain of chondroverse. In particular, these are useful for certain of chondroverse. In particular, these are useful for certain of condroverse or injuries (e.g. popers injuries or retinitis pigmentosum), obesity, diabetes, hyperialisation affect the expression of genes which have a role in cell deach. The polymoresis for companial disorders as which have a role in cell deach. The polymoresis of construction and cells are useful in molecular biology including uses as phyridisation processing the construction of articenses of the processing the processing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or
                                                                                                                                                                                                                                                                                                                                               Fong S, Gao W, Gerber H, Grimaldi JC, Gurney AL, Pan J, Paoni NF, Roy MA,

antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for a cell expressing a PRO polypeptide are useful for a cell expressing a PRO polypeptide are useful for modulating the biological activity of polypeptide are useful for modulating the biological activity of polypeptide are useful for modulating the biological activity of polypeptide are useful for modulating the proliferation of conducting a property of monateal chart, inhibiting vaccular endothelial growth factor (VEGP) stimulated bear, inhibiting vaccular endothelial growth factor (VEGP) stimulated complexed to proliferation of endothelial cells, modulating proliferation of gene which have a role in cell death. The generating remains and proliferation of gene which have useful in cell death. The generating remains and proliferation of cells proliferation and for individuals with generic discontant to effect of the proliferation of profice assays for proces as therapeutic ally and proliferation of profi

Ferrara N; n ME, Goddard A; Kljavin IJ; Tumas D; Botstein D, Desnoyers L, Eaton DL, Fong S, Gao W, Gerber H, Gerritsen Grimaldi JC, Gurney AL, Hillan KJ, an J, Paoni NP, Roy MA, Stewart TA, Pan J, Pao I, Wood WI; New nucleic acid encoding a PRO polypeptide for use as hybridization probes, in chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy for treating e.g. cancer, Parkinson's disease

# Example 38; Page 101; 471pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptide are useful for detecting other PRO polypeptides in a sample and for linking a bloactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptide are useful as pharmaceuticals, diagnostics, biosensors or polymcleotides are useful for stimulating hypertrophy of neonatal contractors. These are useful for stimulating hypertrophy of neonatal contractors. These are useful for stimulating hypertrophy of neonatal contractors. These are useful east of stimulated T-lymphocytes, enhancing the survival or proliferation of candothelial growth factor (VEGF)-stimulated cartinal neurons or rod photoreceptor cells, inducing repoliferation of chondrocytes. In particular, these are useful for cells, modulating proliferation of chondrocytes. In particular, these are useful for cells, modulating proliferation of chondrocytes. In particular, these are useful for cells, modulating parentsulm, observed injuries or retinitis pigmentosum), observed injuries (e.g. sports injuries or retinitis pigmentosum), observed injuries (e.g. sports injuries or retinitis pigmentosum), observed cartilage disorders (e.g. sports injuries or arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polymucleorides are useful in molecular biology including uses as hybridisation probes for cDNA, in chromosome and gene mapping, in the generation of antisense RNA

and DNA, for preparing PRO polypeptides, for generating transgenic
animals or knockout animals which are useful in the development and
screening of therapeutically useful reagents, as probes and for the
genetic analysis of individuals with genetic disorders as well as for
recombinantly expressing the protein and for chromosome identification.
The proteins are useful as molecular marker for protein electrophoresis
purposes, as therapeutic agents, for screening compounds to identify
the PRO polypeptide (angaonists). The polynucleotides and proteins are
useful for tissue typing. PRO antibodies are useful for
immunohistochemical staining and/or assay of sample fluids. Anti-PRO
antibodies are useful in diagnostic assays for PRO e.g. detecting its
cypression in specific cells, tissues or serum and for affinity
purfication of PRO from recombinant cell culture or natural sources. The
PRO genes may also be used in gene therapy, particularly for replacing a
conferctive gene. The sequence presented is a DNA probe which was used to
defective gene. The sequence presented is a DNA probe which was used to
detect a PRO polynucleotide of the invention. NOTE: This sequence is
different from SEQ ID NO 239 in Example 38 of the disclosure but is ö tissue typing; immunohistochemical staining; gene therapy; neonatal heart; vascular endothelial growth factor; VEGF; proliferation; endothelial cell; stimulated T-lymphocyte; retinal neuron; rod photoreceptor cell; c-fos; glucose; FFA; chondrocyte; cardiac insufficiency disorder; wound; cancer; tumour; retinal disorder; retinitis pigmentosum; obesity; diabete; hyperinaulinaemia; hypoinsulinaemia; bone disorder; cartilage disorder; sport injury; arthritis; cardiant; vulnerary; cytostatic; ophthalmological; osteopathic; antiarthritic; anorectic. The invention discloses isolated PRO Secreted/Transmemorate polypepitides on the invention discloses isolated PRO Secreted/Transmemorate polypepitides for infining a caribodises that specifically bind to the PRO bolypepitide for indiving a bioactive molecule to a cell expressing a PRO protein and for modulating to restrict members of the propertied. For linking a bioactive molecule to a cell expressing a PRO protein and for inking a bioactive molecule to a cell expressing a PRO polypepitide. The PRO polypepitide on the propertied on the propertied on the propertied of a cell expressing PRO polypepitides. The PRO polypepitide on the propertied of a cell expression protein and propertied or treating or addactical cells, inducing of proliferation of endothelial cells, modulating the proliferation of crimulated propertied or treating cardac insufficiency disorders, wounds, cancerous crimulated or lumphocytes, enhancing the survival or proliferation and/or retinal neurons or rod photocreceptor cells, inducing proliferation and/or recinal medical control control of chondrocytes. In particular proliferation probes or FPA uprake. In particular proliferation probes or the properties of chondrocytes. In particular proliferation probes or ceinflish prometorular, or bone or cartilage disorders (e.g. sports injuries or architical in mammals. PRO polypeptides and their portions affect the crimular in particular properties are useful in molecular bology including uses as hybridisation probes or properties of properties and profession of genes which have a role in cell and profession of genes which have a role in cell and profession of properties and profession and DAN, for preparing PRO polypeptides and their procession and DAN, for preparing PRO polypeptides of the properties are useful in molecular profession and DAN in thromosom The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to rais Ferrara N; ME, Goddard A; Kljavin IJ; Isolated nucleic acid encoding a polypeptide useful for various Tumas D; Botstein D, Desnoyers L, Eaton DL, 1 Fong S, Gao W, Gerber H, Gerritsen I, Grimaldi JC, Gurney AL, Hillan KJ, 1 Pan J, Paoni NF, Roy MA, Stewart TA, Wood WI; applications e.g. hybridization probes Example 38; Page 103; 474pp; English. 2000WO-US015264. 2000WO-US020710. 2000WO-US023328. 24-AUG-2000; 2000WO-US023328. 18-SEP-2000; 2000US-00665350. 2000WO-US014042 (GETH ) GENENTECH INC WPI; 2004-106404/11. to detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptides. The PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptides are useful for medulating the biological activity of polypeptides are useful for stimulating hypertophy of menatal beart, inhibiting vascular endothelial growth factor (WEGP)-stimulated proliferation of endothelial cells, medulating propletrophy of menatal neart, inhibiting vascular endothelial growth factor (WEGP)-stimulated proliferation of endothelial cells, medulating the proliferation of cells, modulating the survival or proliferation of retinal neurons or rod photoreceptor cells, inducing proliferation of cells, modulating glucose or FPA uptake, inducing proliferation and/or redifferentiation of chondrovtes. In particular, these are useful for cells, modulating and act in information or cartilage (e.g. loss of sight due to cells, modulating and act in markiticism in mammals.)

CC through retinal disorders or injuries (e.g. loss of sight due to retinate processor to robar interpressor or paper and their portions affect the arthritis promours, retinate processor in markiticismulandia.

CC copy. The propers or bone for a cartilage disorders (e.g. sports injuries or retinitis programents or bone for the in cell death. The polymucleotides are useful in molecular biology including uses as hybridisation probes for or DNA inheary to isolate the full-length PRO cDNA or to isolate other combinant or knockout animals which have a role in cell death. The polymucleotides and by, for preparing PRO pulpaptides, for generating engance in an males or knockout animals which have a role in cell death. The protein and for combinantly expressing the protein and for chromosome identification. The protein are useful in mid and protein are useful in mid and protein are useful for individuals with generate for properse, as therespentic dented and some probes and protein and pro

The invention discloses isolated PWO Secreted/Transmembrane Dolypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodise that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful cfor detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptide. The PRO polypeptide or polymeptide are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. The PRO sequences can be used in gene and protein therapy. The PRO polypeptide, the agonist or antagonist or the anti-PRO antibody. The propeptides are used as hybridisation propes for generating transgenic animals useful in the development and screening of useful reagents, in chromosome identification or for tissue typing. The PRO polypeptides are used as hybridisation or for tissue typing. The PRO polypeptides are used as hybridisation or for tissue typing. The PRO polypeptides are used as hybridisation probes for gene mapping, cuseful reagents, in chromosome identification or for tissue typing. The PRO polypeptides are also useful in gene therapy, may be employed as conductoral weight markers for protein electrophoresis or as therapeutic agents. Anti-PRO antibodies are useful in diagnostic assays or for the affinity purification of PRO for recombinant cell culture or natural sources. The sequence presented is a DNA probe which was used to detect a PRO polypucide of the invention. NOTE: This sequence is described as PRO DNO 239 in Example 38 of the disclosure but is different from SEQ ID NO 239 in Example 38 of the disclosure but is different from SEQ ID NO 239 represented in the Sequence Listing. New secreted and transmembrane PRO polypeptides and nucleic acids, useful in gene therapy, as molecular weight markers for protein electrophoresis, as hybridization probes or as therapeutic agents. The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raison Gaps ò Mather JP; 0.9%; Score 14.4; DB 1; Length 18; 93.8%; Pred. Ferrara N; ME, Goddard A; Kljavin IJ; Tumas D;

Novel isolated native PRO polypeptide useful for tissue typing, ar molecular weight markers in protein electrophoresis, for treating enterocolitis, Zollinger-Ellison syndrome, congenital microvillus atrophy.

Example 38; Page 99; 470pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antithe that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO protein and for Inking a tordetecting other PRO polypeptides in a sample and for linking a bloactive molecule to a cell expressing a PRO polypeptides are useful complement of polypeptides of polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides or polypeptides are useful for security of polypeptides or polypeptides are useful for simulating hypertrophy of neonatal heart, inhibiting vascular endothelial growth factor (VEGF)-stimulated culliferation of endothelial cells, inducing the proliferation of stimulated retimulated or proliferation of celimilated retimulated or proliferation of celimilated retimulating the proliferation of celimilated proceptor cells, inducing c-fos in endothelial

differentiation of chondrocytes. Inparticular, these are useful detecting or treating student in particular, these are useful for detecting or treating cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. isight due to retinitis pigmentouum), obesity, diabetes, hyperinsulinaemia, cancerous tumours, page or retinitis pigmentouum), obesity, diabetes, hyperinsulinaemia, cardial disorders (e.g. sports injuries or arthritis) in mammals. PRO polypetides and their portrions affect the expression of genes which have a note in cell death. The polymucleotides are useful in molecular biology including uses as hybridisation probes or cor DNA library to isolate the full-length RNO cDNA or to isolate other CDNAs, in chromosome and gene mapping, in the generation of antisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic animals which are useful in the development and screening of therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for recombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify the PRO polypeptide (angonists) or prevent the effect of the PRO polypeptide (angonists). The polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample fluids, Anti-PRO antibodies are useful for in all and and and protein processing the protein and for angele or discourted and an antibodies and proteins are useful for any and and any processing for professing the processing t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a DNA probe which was used to described as SRO ID NO 239 in Example 38 of the disclosure but is different from SRQ ID NO 239 represented in the Sequence Listing.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for modulating the bioactive molecule to a cell expressing a PRO polypeptide are useful compared to a cell expressing a PRO polypeptide are useful compared to a cell expressing a PRO polypeptide and activity of a cell expressing PRO polypeptides in a sample and for linking a bloactive molecule to a cell expressing a PRO polypeptide are useful as pharmaceuticals, diagnostics, biosensors or polymelocides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. The PRO sequences can be used in the preparation of a medicament for the arti-PRO antibody. The nucleic acids encoding PRO condition which is responsive to the PRO polypeptide, the agonist or antagonist or the anti-PRO antibody. The nucleic acids encoding PRO generating transgenic animals useful in the development and screening of useful reagents, in chromosome identification or for tissue typing. The Compared are also useful in gene therapy, may be employed as molecular weight markers for protein electrophoresis or as therapeutic agents. Anti-PRO antibodies are useful in diagnostic assays or for the affinity purification of PRO for recombinant cell culture or natural sources. The sequence presented is a DAM probe was used to detect a sources. The sequence presented is a bank probe which was used to detect a SEQ ID NO 239 in Example 30 cm. ö New PRO polypeptides and nucleic acid molecules, useful in gene therapy, or preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody, e.g. inflammatory diseases, cancer or AIDS. Sixty two isolated nucleic acids encoding a PRO polypeptide, e.g. PRO245 or PRO1868, useful for treating psoriasis and epithelial cancers such as lung squamous cell carcinoma.

# Example 38; Page 103; 426pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful context. PRO polypeptides in a sample and for modulating to bloactive molecule to a cell expressing a PRO polypeptide are useful of polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptide are useful as pharmaceuticals, disgnostics, blosensors or polymelocideds are useful for stimulating hypertrophy of neonatal context, inhibiting vascular endothelial growth factor (VEGF)-stimulated context, inhibiting vascular endothelial growth factor (VEGF)-stimulated context, inhibiting usecular endothelial growth factor (VEGF)-stimulated context, inhibiting usecular endothelial growth factor (VEGF)-stimulated context, inhibiting usecular endothelial growth factor (VEGF)-stimulated context, inhibiting userial cells, modulating the proliferation of context. Context inducing context in cells, modulating the proliferation of chondrocytes. In particular, these are useful for cells, modulating glucose or FFA uptake, inducing c-fos in endothelial cells, modulating pigmentosum), obesity, diabetes, wounds, cancerous tetninis pigmentosum), obesity, diabetes, hyperinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or retinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or expression of genes which have a role in cell death. The polypurclectides are useful in molecular biology including uses as hybridiation probes context. Or context in the generation of solate the full-length proliferation of solate other context.

```
and DNA, for preparing PRO polypeptides, for generating transgenic
animals or knockout animals which are useful in the development and
screening of therapeutically useful reagents, as probes and for the
genetic analysis of individuals with genetic disorders as well as for
recombinantly expressing the protein and for chromosome identification.
The proteins are useful as molecular marker for protein electrophoresis
purposes, as therapeutic agents, for screening compounds to identify
those that minit the PRO polypeptide (agonists) or prevent the effect of
the PRO polypeptide (antagonists). The polynucleotides and proteins are
useful for tissue typing. PRO antibodies are useful for
immunohistochemical staining and/or assay of sample fluids. Anti-PRO
antibodies are useful in diagnostic assays for PRO e.g. detecting its
cypression in specific cells, tissues or serum and for affinity
purification of PRO from recombinant cell culture or natural sources. The
PRO genes may also be used in gene therapy, particularly for replacing a
defective gene. The sequence presented is a PCR primer which was used to
amplify a PRO polynucleotide of the invention. NOTE: This sequence is
described as SEQ ID NO 239 in Example 38 of the disclosure but is
different from SEQ ID NO 239 represented in the Sequence Listing.
                                                                                                                                                                                                                                                                                                                     ö

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nuclear caid encoding them. The polypeptides continking a discretive molecule call encoding them. The polypeptides continking a bloactive molecule to a cell expressing a PRO polypeptides are useful for the properties of the modulating a bloactive molecule to a cell expressing a PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bloactive molecule to a cell expressing a PRO polypeptides are useful for polypeptides or polypeptides antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or bloacetty molecule are useful for modulating hypertrophy of momeral heart, inhibiting vascular endothelial growth factor (VEGF) stimulated heart, inhibiting vascular endothelial growth factor (VEGF) stimulated contingeration of endothelial cells, inducing proliferation of endothelial cells, inducing proliferation of cells, modulating glucose or FRA uptake, inducing proliferation and/or cells, modulating glucose or FRA uptake, inducing proliferation and/or cells, modulating glucose or FRA uptake, inducing proliferation and/or cells, modulating or treating cardiac insufficiency disorders, wounds, cancerous cretinitis pigmentosum), obesity, disorders, inducing proliferation and/or cells, modulating or bose or zartilage disorders, wounds, cancerous retinitis pigmentosum), obesity, disorders, inducing proliferation and/or control arthritish in mammals. PRO polypeptides and thair portions affect the expression of genes which have a role in cell death. The polymuclectides are useful in molecular biology including uses as hybridisation of entience of propersing PRO polypeptides, for generating or transgenic animals or knockout animals which are useful in the devolopment and screening of therapeutically useful respents, for generating propersis of therapeutically which are useful in the protein are useful in a pecific antagnists. The polymuclecting ar purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention. NOTE: This sequence is described as SEQ ID NO 239 in Example 38 of the disclosure but is described as SEQ ID NO 239 in Example 38 of the disclosure but is different from SEQ ID NO 239 represented in the Sequence Listing. Sequence 18 BP; 4 A; 7 C; 4 G; 3 T; 0 U; 0 Other; Example 38; Page 106; 476pp; English

New PRO nucleic acid, useful for producing a PRO polypeptide, manufacturing a medicament for diagnosing or treating tumor, or for tissue typing.

# Example 38; Page 105; 474pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a

bioactive molecule to a cell expressing a PRO protein and for modulating a least one biological activity of a cell. RRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a loadcitive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of polypeptide antibodies are useful for modulating the biological activity polypeptide antibodies are useful for modulating the biological activity polypeptide antibodies are useful for modulating probletation of modulating of a cells, modulating propletation of candibolal cells, modulating probletation of catanitation or rod photoceceptor cells, inducing proliferation of cells, modulating plucose or FRA uptake, inducing proliferation of chomorocytes. In particular these are useful for cells, modulating plucose or FRA uptake, inducing proliferation and/or redifferentiation of chomorocytes. In particular these are useful for cells, modulating plucose or FRA uptake, inducing proliferation and/or redifferentiation of chomorocytes. In particular propletations are tuneated propletation of chomorocytes. In particular polymore and portable and their portions affect the criminals planemals. Propletation of sold propletation and their portions affect the criminals planemals. Propletation of sold propletation and colletation of sold propletation and propletation of sold propletation and propletation of sold propletation and propletation of propletation and propletation of propletation and prop

New nucleic acid encoding a PRO polypeptide, useful for producing a recombinant PRO polypeptide and for treating tumors by gene therapy

## Example 38; Page 101; 471pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides.

and the mucleic acid encoding them. The polypeptides can be used to raise
antibodies that specifically bind to the PRO polypeptide, for linking a
bloactive molecule to a cell expressing a PRO protein and for modulating
at least one biological activity of a cell. PRO polypeptides are useful
for detecting other PRO polypeptides in a sample and for Inhking a
bloactive molecule to a cell expressing a PRO polypeptide. The PRO
co polypeptide antibodies are useful for modulating the biological activity
of a cell expressing PRO polypeptides. The PRO polypeptide or
co polypeptide are useful for simulating hypertrophy of neonatal
complex to these are useful for modulating the proliferation of
complex to the proposed or the proposed or cells, modulating the proliferation of
complex to fendothelial cells, modulating the proliferation of
complex to fendothelial cells, modulating co-fos in endothelial
complex to fendothelial cells, modulating the proliferation of
cother and complex to the cells, modulating the proliferation of
cother modulating glucose or FRA uptake, inducing c-fos in endothelial
cother transing glucose or FRA uptake, inducing c-fos in endothelial
cother transing glucose or FRA uptake, inducing proliferation and checting or treating or treating cardiac insufficiency disorders, wounds, carcerous
cother modulation of chondrocytes. In particular, these are useful for
cretinitis pigmentosum), obesity, diabetes, hyperinsulinaemia,
cother transilinaemia, or bone or cartilage disorders (e.g. sports injuries or
arthritis) in mammals. PRO polypeptides and their portions affect the
corpha, in chromosome and gene mapping, in the generating transgenic
condamns, rectinity proprepring PRO polypeptides, for generating transgenic
condamns or knockout animals which are useful in the development and
corporating of therapeutically are generally in the development and
corporative proper proper propertices are properting to the propertically or preparing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              30-NOV-
    genetic analysis of individuals with genetic disorders as well as for recombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful for tissue typing. PRO antibodies are useful for assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its captession in appecific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a DRA probe which was used to detect a PRO polymucleotide of the invention. NOTE: This sequence is described as SEQ ID NO 239 in Example 38 of the disclosure but is
                                                                                                                                                                                                                                             ó
                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; PCR; primer; ss; PRO; secreted; transmembrane; therapeutic; tissue typing; immunohistochemical staining; gene therapy; nencental heart; vascular endothelial growth factor; VEGF; proliferation; endothelial cell; stimulated T-lymphocyte; retinal neuron; rod photoreceptor cell; c-fos; glucose; FFA; chondrocyte; cardiac insufficiency disorder; wound; cancer; tumour; retinal disorder; retinitis pigmentosum; obesity; diabete; hyperinsulnaemia; hypoinsulnaemia; bone disorder; cartilage disorder; sport injury; arthritis; cardiant; vulnerary; cytostatic; ophthalmological; osteopathic; antiarthritis; anorectic.

ADM25390 standard; DNA; 18 BP 8-OCT ADM2539( The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise and the nucleic acid encoding them. The polypeptides not be used to raise and the nucleic acid encoding them. The polypeptides are useful to the RRO polypeptides are useful activity of a cell. PRO polypeptide are useful activity of a cell. PRO polypeptide are useful activity of a cell. Expressing a PRO polypeptide are useful activity of a cell expressing a PRO polypeptide are useful as pharaceuticals, diagnostics, blosensors or lorgestides are useful as pharaceuticals, diagnostics, blosensors or polymotheorides are useful as pharaceuticals, diagnostics, blosensors or polymotheorides are useful for the standard of endothelial cells, modulating the proliferation of endothelial cells, modulating the proliferation of conformation and particular, these are useful for ethics are useful for the standard of chondrocytes. In particular, these are useful for ethics are related action in the standard action and/or relativity of cells, modulating discorders or right action in particular, these are useful for detecting or treating cardiac insulficiency disorders, wounds, cancerous culfiferantiation of chondrocytes. In particular, these are useful for detecting or treating cardiac insulficiency disorders, wounds, cancerous criticis pigmentosum, obesity, planetes of propried and disorders and process or propertions and process or call disorders and process or cell activities or expression of genes which have a role in cell death. The polymuclectides are useful in motecular biology including uses as hybridisation probes for convent animals which are useful actions and processing of the action and for chromosome and gene mapping in the generating transgenic configuration of motecular biology including user as processing the processing of processing of purposessing the processing are useful an encourage of the processing of purposessing the processing are useful an encourage of the pr Isolated secreted and transmembrane PRO nucleic acids and the proteins they encode, e.g. PRO245, PRO269 and PRO1868, useful for preventing, diagnosing and treating e.g. disorders relating to blood coagulation. Sixty one isolated nucleic acids encoding a PRO polypeptide, e.g. PRO245 or PRO1868, useful in chromosome and gene mapping, in generating antisense RNA and DNA, and in treating cancer and Alzheimer's disease.

# Example 38; Page 112; 483pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a

CC bloadcive molecule to a cell expressing a RPO polypeptide. The RPO polypeptide antibodies are useful for modulating the biological activity of polypeptide antibodies are useful as pharmaceuticals, diagnostica, biosensors or polynucleotides are useful for stimulating hypertrophy of meonatal heart. Inhibiting vascular endothelial growth factor (VEGF) estimulated proliferation of endothelial cells, modulating proliferation of endothelial cells, modulating proliferation of choraccytes, enhancing the survival or proliferation of endothelial growth factor (VEGF) estimulated cells, modulating glucose or FRA uptake, inducing proliferation and/or receips, modulating glucose or FRA uptake, inducing cross in endothelial cells, modulating glucose or FRA uptake, inducing proliferation and/or redetecting or treating cardiac insufficiency disorders, wounds, cancerous cumours, retinal disorders or injuries (e.g. loss of sight due to chiff this pigmentosum), obesity, diabetes, hyperimulinaemia, in the genes which have a role in cell death. The polymucleotides are useful in molecular biology including uses as hybridisation probes or chritis) in mammals. PRO polypeptides and their portions affect the conformation of procone and genes mapping, in the generation of antisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic and DNA, for preparing PRO polypeptides, for generating transgenic and process, as therapeutically useful reagents, as probes and for the generation of therapeutically useful reagents, as probes and for the generation of the process and for chromosome identification. The proteins are useful in diagnostic assay for RNO escenting of useful calling and/or assay of sample fluids. Anti-PRO immunohistochemical scalining and/or assay of sample fluids. Anti-PRO immunohistochemical scalining and/or assay of sample fluids. Anti-PRO cumunohistochemical scalining the process or serum and process o bioactive molecule to a cell expressing a PRO polypeptide. The PRO

New PRO nucleic acid, useful for preparing a composition for treating e.g., tumor or for tissue typing.

Example 38; Page 101; 472pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptide can be used to raise and the nucleic acid encoding them. The polypeptide can be used to raise can tibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO polypeptide are useful for a cell expressing a PRO polypeptides are useful conductive molecule to a cell expressing a PRO polypeptides are useful for acid lating to a cell expressing strongly by the biological activity of a cell expressing strongly by polypeptides. The PRO polypeptides or bioacative molecule as planmaceuticals, diagnostics, biosensors or bioreactors. These are useful for stimulating hypertrophy of neonatal heart, inhibiting vascular endothelial growth factor (VEGP) stimulated conductors. These are useful for stimulating hypertrophy of neonatal heart, inhibiting vascular endothelial growth factor (VEGP) stimulated cells, modulating the proliferation of endothelial cells, modulating the proliferation of condrocyces, enhanced as urvival or proliferation of condrocyces, enhanced or proliferation of condrocyces, in particular, these are useful for cells, modulating proliferation of condrocyces. In particular, these are useful for cells, modulating or tracting glucose or FRA uperiorilar, these are useful for cells, modulating or tracting or tracting cardiac insufficiency disorders, wounds, cancerous cumours, retinal disorders or injuries of 100 seo for sight due to cells, modulating or tracting or tracting or tracting cardiac insufficiency disorders, wounds, concerous contacting or tracting or tracting propositions and their portions affect the are useful in molecular biology including or described and bulk, for preparing PRO polypeptides and their portions affect the company, or preparing PRO polypeptides for generating transgenic combinantly expressing the procein and for chromosome and gene mapping, in the generating cardiac endicated as well in a molecular market

ö
          useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a DNA probe which was used to detect a PRO polynucleotide of the invention. NOTE: This sequence is described as SEQ ID NO 239 in Example 38 of the disclosure but is different from SEQ ID NO 239 represented in the Sequence Listing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antibodies binding PRO polypeptides, useful in gene therapy, or in diagnostic assays for the PRO polypeptides, or for the affinity purification of PRO polypeptides from recombinant cell culture or natural
polypeptide (antagonists). The polynucleotides and proteins are

The invention relates to an antibody that binds to a human PRO polypeptide. The invention also relates to human PRO polypucleotides encoding the PRO polypeptides of the invention. The antibody is a monoclonal or humanised antibody, or is an antibody fragment, and is preferably labelled. The anti-PRO antibodies may be used in diagnostic assays for PRO, or for the affinity purification of PRO from recombinant cell culture or natural sources. This sequence represents a PCR primer used in isolation of a human PRO polynucleotide of the invention.

                                                                                                                                                                                                                                                              Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAABASTS. to AAABG787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a companie of the segment encoding (I). (I) can have antiposcriatic, dermatclogical, cytostatic, antiseborrheic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carlingma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH$7577 to AAH$2089 represent sequences used in the exemplification of the present invention

New short interfering nucleic acid molecules which down-regulates expression of a hepatitis B virus (HBV) or which inhibits HBV replication, useful for treating human HBV infections or for characterizing gene function.

Claim 11; Page 47; 72pp; English.

the invention relates to a since interieting indicated acta (sind) molecule that down-regulates expression of a hepatitis B virus (HBV) gene by RNA interference or that inhibits HBV replication. Also disclosed are the collowing: (1) a method of modulating the expression of a HBV gene in a tissue explant; (11) a method of generating a library of sinA constructs having predetermined complexity; (iii) a cell containing one or more sinA complexity; (iii) a cell containing one or more sinA complexity; (iii) a cell containing one or more sinA complexity in a method of supplemental a cell, tissue or corganism; and (v) a method for synthesising a sinA molecule. The sinA corporate is adapted for use to treat HBV infection, and comprises a sense and an antisense region, where the antisense region comprises sequence complementary to an RNA sequence encoding HBV and the sense region comprises the molecule is assembled from 2 nucleic acid fragments, where one fragment comprises the sense region of the sinA molecule, where sense region and the sinA molecule is a polynucleotide antisense region of the sinA molecule, where sense region and the antisense region and the antisense region comprises as 3'-centainal overhang and the antisense region comprises and are covalently connected via a linker molecule. The linker molecule is a polynucleotide. The antisense region 3'-terminal overhang seach comprises about 2 nucleotides. The antisense region 3'-terminal overhang is complementary to RNA configurations, and for characterising pathways of genee function, e.g. to inhibit activity of target genes in a pathway to determine the function of uncharacterised genes in a pathway to determine the function of uncharacterised genes in a pathway to determine the function of uncharacterised genes in a pathway to determine the function of uncharacterised genes in a pathway to determine the function of uncharacterised genes in a pathway to determine the sina contains. The invention relates to a short interfering nucleic acid (siNA) molecule

tissue explant; (ii)) a method of generating a library of siNA constructs having predetermined complexity; (iii) a cell containing one or more siNA molecules; (iv) a kit containing a siNA molecule which can be used to modulate the expression of a HBV target gene in a cell; tissue or organism; and (v) a method for synthesising a siNA molecule. The siNA companies region, where the antisense region comprises sequence complementary to an RNA sequence encoding HBV and the sense region comprises sequence complementary to the antisense region comprises the sense region and the sense region and the sense region and the sense region and the siNA molecule is assembled from 2 nucleic acid fragment comprises the sense region of the siNA molecule. Where sense region and the comprises region of the siNA molecule. The linker molecule is a polynucleotide antisense region comprise separate oligonucleotides, and are covalently connected via a linker molecule. The linker molecule is a polynucleotide linker or a non-nucleotide linker. The sense region comprises a 3'-terminal overhang is comprises a 3'-terminal overhang is comprises a 3'-terminal overhang is complementary to RNA encoding HBV. The sink is useful for treating human hepatitis B virus contining HBV. The sink is useful for treating human hepatitis B virus contining HBV. The sink is useful for treating human hepatitis B virus contining the activity of target genes in a pathway to determine the function and/or research settings. The sink molecules and/or research settings. The sink and continings. The presents of page of the function and/or research settings.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to a short interfering nucleic acid (siNA) molecule that down-regulates expression of a hepatitis B virus (HBV) gene by RNA contreferance or that inhibites HBV replication. Also disclosed are the following: (i) a method of modulating the expression of a HBV gene in a cilcusus explant; (ii) a method of generating a library of siNA constructs having predetermined complexity; (iii) a cell containing one or more siNA molecules; (iv)a kit containing a siNA molecule which can be used to complement or an expression of a HBV target gene in a cell, tissue or correct in an antisense region, where the antisense region comprises sequence complementary to an RNA sequence encoding HBV and comprises sequence complementary to an RNA sequence encoding HBV and the sense region comprises the sense region and the sense region. The siNA molecule is assembled from 2 nucleic acid fragments, where one fragment comprises the sense region and the second fragment comprises the sense region of the siNA molecule. Where sense region and the constructed via a linker molecule. The linker molecule is a polynucleotides. Comparises region of the siNA molecule of indication and the antisense region comprises a 3'-terminal overhang and the antisense region comprises a 3'-terminal coverhang seach comprises a 3'-terminal coverhang is complementary to RNA.

The antisense region of the antisense region comprises a 3'-terminal coverhang and the antisense region comprises a 3'-terminal coverhang seach complementary to RNA.

The antisense region of the singent foor tracting hand he pathway of gene function, e.g. to inhibit activity of target genes in a pathway to determine the function and/or researce sense region comprises a 3'-terminal coverhang seach setting gene function and presents sequence of sundering gene function and presents of the present sequence represents 1 of 1504 HBV sinal propersions.
                                                                                                                                                                                                                                                                                     New short interfering nucleic acid molecules which down-regulates expression of a hepatitis B virus (HBV) or which inhibits HBV replication, useful for treating human HBV infections or for

MORRISSEY BEIGELMAN

(MORR/) (MCSW/) (BEIG/) WPI; 2003-901032/82.

New short interfering nucleic acid molecules which down-regulates expression of a hepatitis B virus (HBV) or which inhibits HBV replication, useful for treating human HBV infections or for characterizing gene function.

Claim 11; Page 47; 72pp; English.

that down-regulates expression of a hepatitis B wirus (HHW) gene by RNA interference or that inhibits HBV replication. Also disclosed are the following: (i) a method of modulating the expression of a HBV gene in a tissue explant; (ii)) a method of generating a library of siNA constructs having predetermined complexity; (iii) a cell containing one or more siNA molecules; (iv) a kit containing a siNA molecule which can be used to modulate the expression of a HBV target gene in a cell; tissue or cranism; and (v) a method for synthesising a siNA molecule. The siNA molecule is adapted for use to treat HBV infection, and comprises a sense complementary to an RNA sequence encoding HBV and the sense region comprises sequence complementary to the antisense region. The siNA comprises the sense region and the second fragment comprises the comprises the sense region and the second fragment comprises the comprises region of the second fragment comprises the sense region of the second fragment region and the invention relates to a short interfering nucleic acid (siNA) molecule antisense region comprise separate oligonuclectides, and are covalently connected via a linker molecule. The linker molecule is a polynuclectide linker or a non-nuclectide linker. The sense region comprises a 3'-terminal overhang and the antisense region comprises a 3'-terminal overhang a 3'-terminal overhangs each comprise about 2 nuclectides. The Antisense region 3'-terminal overhang is complementary to RNA encoding HBV. The siNA is useful for treating human hepatitis B virus infections, and for characterising pathways of gene function, e.g. to inhibit eactivity of target genes in a pathway to determine the function of uncharacterised genes in gene function analysis. The siNA molecules may also be used in clinical, industrial, environmental, agricultural so be used in clinical, industrial, environmental, a research settings. The present sequence represents sina molecules of the invention.

New small interfering polynucleotide that modulates protein tyrosine phosphatase (PTP)1B polypeptide signal transduction, useful for treating disorders associated with altered PTP1B signal transduction, e.g. diabetes or cancer.

Wilson LK;

Lewis SP, Klinghoffer R,

WPI; 2004-035036/03.

Example 3; SEQ ID NO 566; 234pp; English.

The invention relates to a novel isolated small interfering RNA (siRNA)

Computation defined sequences given in the specification. The invention further relates to: a pharmaceutical composition comprising a new siRNA polynucleotide and a physiological carrier; a recombinant nucleic acid construct, comprising a polynucleotide that is capable of directing transcription of an siRNA; a host call transformed or transfected with the above recombinant nucleic acid construct; a method for interfering the above recombinant nucleic acid construct; a method for interfering cis variant; a method for identifying a component of a PTP1B signal cis variant; a method for modulating an insulin receptor protein phosphorylation state in a cell; a method for altering a Jak2 protein phosphorylation state in a cell; an method for treating a Jak2 protein phosphorylation state in a cell; an enthod for treating a Jak2 protein phosphorylation state in a cell; an enthod for treating a Jak2.

Component of a protein treating disorders antidiabetic, anorectic, antimifiammatory, neuroprotective, cytostatic, immunosuppressive, and antimicrobial. The novel siRNA polynucleotides can be used in gene therapy to treat disorders. The composition and methods are used in gene therapy to treat disorders. The composition and methods are used in gene therapy to treat disorders associated with PTP1B—mediated signal transduction, such as diabetes, obesity, hyperglycaemia induced apoptosis, inflammation, neurodegenerative disorders, cancer, autoimmune diseases or inflating polymuclectide sequence represents an siRNA used for modulating the signal transduction of a protein tyrosine phosphatase of the invention.

A. odontolyticus 16S rRNA fragment.

```
The present invention relates to a primer set and method for mapping at least the variation/mutation part of a plant gene using a gene polymorphism marker. A mutation site of the plant gene is mapped by utilizing a genetic polymorphism marker as follows: (a) genomic DNA is prepared from a plant homozygously having a mutation to be an object of the mapping; (b) A forward primer 1 containing a base corresponding to the gene polymorphic maker of one ecotype plant, a forward primer 2 containing a base corresponding to the genetic polymorphism of the other with both the ecotype plants are prepared; (c) two kinds of with both the ecotype plants are prepared; (c) two kinds of oligonucleotides emitting fluorescence of different colors when the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A primer set and method useful for mapping at least the
variation/mutation part of a plant gene using a gene polymorphism marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             genetic polymorphism marker is detected are prepared; (d) an amplification reaction of the genomic DNA is carried out in the presence of the primers 1, 2 and 3 and the two kinds of the oligonuclectides; (e) the fluorescence intensity emitted from the resultant reactional product is detected and (f) the position on the genome of the mutation site is determined from the results of detection. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0.9%; Score 14.4; DB 1; Length 19;

They are also useful for research into oral infections. The carriers allow simultaneous detection of both host and pathogen parameters, providing quickly and simply an individual's paradontitis profile, including detection of pathogens that aggravation of diabetic symptoms, and of opportunistic pathogens.

                                                                                                                                                                                                                                                                                                                          The present into the stripes enzyments are activated and escribes enzyments are cleaving activity, which specifically cleave RNA encoded by an arry hydrocarbon nuclear transporter (ARNY) gene, an integrin alpha 6 subunit gene, an integrin alpha 6 subunit gene, an integrin alpha 6 subunit gene, an integrin subunit beta 3 and AAA1761 to AAA17621 to AAA17623 to AAA1888 sequences for rie-2 and AAA1886 to AAA1987 corresponding target sequences; AAA19154 represent riboxyme sequences for rie-2, and AAA18386 to AAA1988 and AAA19155 to AAA19222 represent their corresponding target sequences; cand AAA19155 to AAA19222 represent their corresponding target sequences; cand AAA19156 to AAA21861 to AAA21850 to AAA21850 and AAA21850 and AAA21850 to AAA21850 and AAA21850 to AAA21852 represent riboxyme sequence for integrin subunit beta 3, and AAA22362 to AAA23343 to CAAA23342 represent their corresponding target sequences; corresponding target sequences; corresponding target sequences for integrin subunit beta 3, and AAA23842 represent riboxymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNY, integrin subunit beta-3, integrin subunit alpha-6, or rie-2. They are stability of an mRNA encoding angiogenic factor, especially ARNY, integrin subunit alpha-6, or rie-2. They are mecular degeneration (ARND), inflammation, and arthritis, as well as a meliofith rie of tubercosis, pot-wine stains, verruca vulgaris, and coll machines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes. DNAzymes, and enzymes, zinzymes, amberzymes, and G-cleaver ribozymes. DNAzymes, incymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed transcriptase and/or HBV reverse transcriptase primer sequences, as well so oligomucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of from transcriptase states related to HBV and HCV infection, replication and gene compounds of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ٠<u>;</u>

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymet, amberzymes, and errors are nucleic acids such as hammerhead ribozymes. BNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase and/or HBV reverse transcriptase and/or has pecifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds char modulate the expression and/or replication of HCV. The compounds mad methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV indication in indication and gene carcinoma. The present sequence represents a substrate for one of the HBV indication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                     Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme;

```

```
The invention relates to an isolated human GTP-activator protein for Rab-
[1], a sequence having 65% identity to
[1], a sequence in which at least 93% of deviations from (1) are
[2] as sequence in which at least 93% of deviations from (1) are
[3] as sequence in which at least 93% of deviations from (1) are
[4] as sequence in which at least 93% of deviations and no
[5] acids of (1). The polypeptide is useful for identifying a specific
[5] acids of (1). The polypeptide is useful for identifying a specific
[5] binding partner for itself, by contacting the polypeptide binding
[5] contained binding partner and determining if the polypeptide binding
[5] contained binding partner and determining if the polypeptide binding
[5] contained binding partner determining if the polypeptide binding
[5] contained [1] are useful for diagnosing or monitoring a disease caused
[5] contained with decreased expression or preventing a disorder
[5] contained with decreased expression or activity of GAPN, and an
[6] associated with increased expression or activity of GAPN, and an
[6] attagonist of (1) is useful for treating or preventing a disorder
[6] associated with increased expression or activity of GAPN, and an
[7] attagonist of (1) is useful for treating or preventing a disorder
[7] associated with increased expression or activity of GAPN, and an
[7] attagonist of (1) is useful for treating or preventing a disorder
[7] containing and as hybridization probes to detect, characterize and
[7] contified and as hybridization probes to detect, characterize and
[7] containing the determinant of solate GAPN nucleic and genence
[7] represents a 17-mer oligonucleotide spanning the GAPN NA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated human GTP-activator protein for Rablike GTPase (GAPN) polypeptide (I), a sequence having 65% identity to (I), a sequence in which at least 95% of deviations from (I) are conservative substitutions, or a tragment of at least 8 contiguous amino acids of (I). The polypeptide is useful for identifying a specific binding partner for itself, by contacting the polypeptide in vivo to a potential binding partner and determining if the polypeptide binding partner binds to the polypeptide (II) and a nucleic acid encoding the polypeptide (II) are useful for diagnosing or monitoring a disease caused by altered expression of GAPN, by determining the level of expression of GAPN in a sample of nucleic acids or proteins that derives from a subject suppected to have the disease, alterations from a normal level of expression providing diagnostic and/or monitoring information. (I), (II) or agonist of (I) is useful for treating or preventing a disorder associated with decreased expression or activity of GAPN, and an antagonist of (I) is useful for treating or preventing a disorder associated with increased expression or activity of GAPN, and an antagonist of (I) is useful for treating or preventing a disorder consisted with increased expression or activity of GAPN, and an antagonist of (I) is useful for treating or preventing a disorder consisted with increased expression or activity of GAPN, and an antagonist of (I) is useful for treating or preventing a disorder associated with increased expression or activity of GAPN, and an antagonist of (I) is useful for treating or preventing a disorder associated with increased expression or activity of GAPN, and an accompance of the proteins. (II) is useful to drive in vivo expression of accompanies and accompanies and isolate GAPN nucleic acids from both genomic and transcript-derived nucleic acid samples. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel human GTP-activator protein for Rab-like GTPase and polynucleotide encoding the protein, useful for diagnosing, treating or preventing disorders associated with increased expression or activity of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an enzymatic nucleic acid molecule that specifically cleaves RNA derived from hepatitis B virus (HBV) and comprising one or more binding arms, without requiring the presence of a 2-0H group within the molecule for activity. The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, hepaticis. Combination with other therapies such as lamivadine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, we perpresent a sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The method is useful for selective ex vivo expansion of stem cells. The recombinant human interleukin-3 variant or mutant proteins are useful for treating a patient having a harmatopoletic disorder, such as cancer (e.g. acute myelogenous leukaemia or certain types of Blymphoid cancers), leukopenia, neutropenia, aplastic anaemia, Chediak-Higashi's syndrome, systemic lupus erythematosus, myelodysplastic syndrome, or myelofibrosis. The interleukin-3 miteins are also useful as antagonists for producing interleukin-3 miteins are also useful as antagonists for producing interleukin-3 miteins are also useful as antagonists for producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Selective ex vivo expansion of stem cells, useful for treating a patient having hematopoietic disorder, e.g. leukemia, neutropenia or aplastic anemia, comprises using recombinant human interleukin-3 variant or mutant
interleukin antagonist 3; gene therapy; ex vivo expansion of stem cell; modified human interleukin-3; cell proliferation; acute myelogenous leukaemia cell proliferation; TF-1 cell proliferation; methylcellulose assay; haematopolatic disorder; cancer; acute myelogenous leukaemia; B lymphoid cancer; leukopenia; neutropenia; aplastic ansemia; Chediak-Higashi's syndrome; leukopenia; neutropenia; systemic lupus erythematosus; myelodysplastic syndrome; myelofibrosis; bone marrow; blood cell activation; blood cell growth; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           stimulating bone marrow and blood cell activation and growth before infusion into patients. This sequence represents an ex vivo stem cell expansion method associated polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gарв

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes cultured stem cells obtained by a method for selective ex-vivo expansion of stem cells comprising separating stem cells from other cells, culturing the separated stem cells with a selected media which comprises a human interleukin-3 mutent polypeptide comprising defined amino acid sequences SEQ ID NO 15 or 19 given in the specification, and harvesting the cultured cells. The methods and compositions of the present invention are useful for treating aplastic anaemia, cyclic neutropenia, idiopathic neutropenia, Chediak-Higashi syndrome and myelofibrosis. This sequence represents a DNA used in the construction of human interleukin 3 (IL-3) mutants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Culturing stem cells using a recombinant human interleukin-3 mutant polypeptide, useful for treating aplastic anemia, neutropenia, Chediak-Higashi syndrome, systemic lupus erythematosus, leukemia and myelodysplastic syndrome.

pCGN783 ATCC 67868 contg. the 1 ATG-kanamycin resistance gene is cloned into EcoRI-Smal digested Bluescript M13KS to create pBsKm; this plasmid contains an M13 region allowing generation of single stranded DNA. Single stranded DNA is generated in vitro mutagenesis is performed using the sequence below, to alter a PstI site with the kanamycin resistance gene and make it undigestable, creating pCGN1534
Mutagenesis; pCGN783; pBSKm; M13KS; pCGN1543; kanamycin; resistance; ss.
                                                                                                                                                                                                                                                                                                                                                                                                             High level expression in plant cell hosts - using the CaMV 35S upstream activating region to enhance the mannopine synthase promoter.

11, 16, 18 or 33. The probes and primers AAT44608-T44693 are esp. used to detect HPV types 26, 31, 318, 35, 39, 40, 43, 45, 51-59 and 68. The primers can be used to detect these HPV types in conjunction with the consensus primers and typing probes AAT44733-T44906, which are based on and amplify fragments of the Li. E6, E7 and E1 regions of the HPV sequences. This primer is targeted to the new HPV type 31. (Updated on 25-MAR-2003 to correct PF, field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is a human papillomavirus 31 (HPV31) specific typing probe.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (fl.1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAXA7575 to AAX7572 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                    Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                             stability – useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                Mouse flt-1 VEGF receptor hammerhead ribozyme substrate #452
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 13.8; DB 1; Length 17;

A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour rapidogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tlu-1; discanging rapidgemesls; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cytochrome P4502A6; CYP2A6; diagnosis; metabolic activity; substrate; human; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity (e.g. ribozymes) which are capable of modulating the expression of plant genes: (i) involved in biosynthesis of alkaloids; or (ii) involved in Flower formation. AAV95982 to AAV96334, and AAV96335 to AAV96354 represent potato solanidine glucosyltransferase hammerhead and hairpin ribozymes, respectively. AAV95629 to AAV95981, and AAV96355 to AAV96734 represent potato solanidine glucosyltransferase target
                                                                                                                                                                                                          Primers AAV11271-V11287 are used to amplify the human cytochrome P4502A6 (CYP2A6) gene for genetic diagnosis by distinguishing the metabolic activity of a substrate for CYP2A6. The method can distinguish a patient with an abnormality in a metabolic pathway requiring CYP2A6
                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                 Genetic diagnosis using human CYP2A6 gene - useful to distinguish an abnormality in the metabolic activity of substrate for CYP2A6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Solanidine, glucosyltransferase, potato, citrate synthase, target, hammerhead ribozyme, hairpin ribozyme, alkaloid biosynthesis; flower formation, cleavage, solanaceous plant, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New enzymatic nucleic acid(s) - useful for, e.g. reducing alkaloid
biosynthesis or regulating flowering.

sequences. AAV96773 to AAV97170, and AAV97171 to AAV97195 represent potato citrate synthase hammerhead and hairpin ribozymes, respectively. AAV96735 to AAV96772, and AAV97196 to AAV9720 represent potato citrate synthase target sequences. Ribozymes of the present invention can be used to inhibit the synthesis of toxic alkaloids in solanaceous plants, particularly potato but also tomato, pepper, aubergine and ditura or to inhibit flowering in potato, lettuce, spinach, cabbage, brussel sprouts, arugula, kale, collards, chard, beet, turnip, sweet potato and turf grass. Also the ribozymes can be used for RNA manipulation in the same way that restriction endonuclasses are for DNA, as well as to examine genetic drift and mutations in plants and to detect specific RNA. The ribozymes can be targeted to specific genes or to consensus sequences within a family of related genes, and being catalytic need to be present at only very low concentrations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a human papillomavirus (HPV) L1 type-specific probe of the invention. This sequence may be used in conjuncture with L1 specific primers for detecting and typing HPV. Identification and typing GF HPV pose different risks for infected individuals. HPV16 and HPV18 have been more consistently identified in higher grades of cervical dysplasia and carcinoma than other HPV types. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human papilloma probes and primers - useful for, e.g. detecting and typing of human papilloma viruses.

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA171681 to AAA17682 to AAA196775 to AAA17168 to AAA17685 and AAA1168 to Fresent their corresponding target sequences; AAA17685 to AAA18185 and AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA18186 to AAA19087 to AAA19223 represent their corresponding target sequences; AAA19223 to AAA19222 represent their corresponding target sequences; AAA19223 to AAA2168 represent their corresponding target sequences; AAA21689 to AAA2168 represent their corresponding target sequences; AAA21689 to AAA2168 represent their corresponding target sequences; AAA21689 to AAA22475 and AAA2343 to AAA23342 represent their corresponding target sequences; AAA21689 to AAA22475 and AAA23476 to AAA23343 to C for integrin subunit beta 3, and AAA23476 to AAA23343, to C for integrin subunit beta 3, and AAA23476 to AAA23343 to C the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARNM), inflammation, and arthritis, as well as mecowascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris,

The method comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endonuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, c-raf, A-raf, B-raf, hammerhead ribozyme, hairpin ribozyme,

cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic secites and infection. They may also be used to detect genetic drift and mutations in diseased cells and to determine c-raf RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of sugar/phosphate modifications increases stability against nuclease and activity. AAV99032 to AAV9387 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; c-raf; A-raf; B-raf; hammerhead ribozyme; hairpin ribozyme; target; enbstrate; catalyst; modulation; expression; Raf gene; delivery; screening; identification; synthesis; deprotection; purification; cancer; inflammation; psoriasis; non-hepatic ascites; infection; genetic drift;

                                                                                                                                                                                                                                                                                                         셤
```

A method has been developed for the identification of a nucleic acid capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic

```
acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with conductease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic acidits and infection. They may also be used to detect genetic drift and mutations in diseased cells and to determine c-raf RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or seed to treat condition associated with the level of c-raf. Introduction of sugar/phosphate modifications increases tability against nuclease and activity. AAV99922 to AAV93877 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   a
                                                                                                                                                                                                                                                                   ö
                                                           The present invention describes a DNA molecule encoding a pathogenesis-related (PR) protein having beta-1,3-glucanase activity selected from PR-2, PR-2', PR-2', PR-A' pro and PR-O'. Also described are: (i) a chimeric gene comprising the above DNA molecule linked to a heterologous promoter; (ii) a vector containing the chimeric gene; (iii) a host cell containing the chimeric gene; (iv) a transgenic plant containing the chimeric gene; and (v) a seed from the transgenic plant. The DNA molecule is used to produce transgenic plants with enhanced disease or pest resistance. The present sequence represents an oligonucleotide from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 orphan receptor, EAR3/COUD-TR-1, the GATA transcription factor gene, IRR-2 and/or the CAATI Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
            producing transgenic plants with enhanced disease or pest resistance.
                                                                                                                                                                                                                                                                   Gaps
 DNA encoding pathogenesis-related glucanase proteins - useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              erythropoietin; granulocyte colony stimulating factor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAAT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

AAF02686/c
                                                                                                                                                                                              RESULT 268
                                                                                                                                                                                                                      AAF07187
```

```
The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, PAR3/COUP-TF-1, the GATA transcription factor gene, IRR-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cerebroprotective; nootropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NOGO; hammerhead ribozyme; DNAzyme; inzyme; inzyme; inzyme; lymphoma; leukaemia; B-cell lymphoma; non-Hodgkin's lymphoma; NHL; lymphoma; non-Hodgkin's lymphoma; NHL; lymphoma; non-Hodgkin's HT associated NHL; mantle-cell lymphoma; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis; chemotherapy-induced neuropathy; amyotrophic lateral sclerosis; ALS; Parkinson's disease; ataxia; Huntington's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Creutzfeldt-Jakob disease; muscular dystrophy; neurodegenerative disease.
                                  Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; 88; antigense therapy; cytostatic; antiinflammatory; haemostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/Or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                   Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cegniates expression of a neurite growth inhibitor gene (NGCO). The cegniates expression of a neurite growth inhibitor gene (NGCO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA control of a divalent cation that is preferably Mg^2+.

The CD20 in the presence of a divalent cation that is preferably Mg^2+.

The Furthermore, it may be contacted with a cell to reduce CD20 activity of the coll and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more thrompose. In particular, the CD20 targetting nucleic acid may be used to creat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-creat lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytopacnia, and inflammatory arthropathy. The NOGO activity of the considered may be contacted with a cel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present
                                  constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cregulates expression of a neutite growth inhibitor gene (NGOD). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving a an RNA molecule DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a C-cleaver (cleaving RNA with a NYN motif) properties an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaver RNA cyle motif). The CD20-targeting nucleic acid is used to cleave RNA cyle contacted with an cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level cyle CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targeting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-thedgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphomy, immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-coll lymphoma, immunocytoma (IMC), small B-cell lymphomy. The NOGO-coll in the cargetient may further call not call and treat a patient having a condition associated with the level of cell and treat a patient having a condition associated with the level of the seence of a divalent cation that is preferably MG'2+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-cargetting nucleic acid may be used to therapies. In particular, the NOGO-cargetting nucleic acid may be used to therapies. In particular, the NOGO-cargetting nucleic acid may be used to the central network of the NOGO-cargetting nucleic acid may be used to the central network of second of one or more therapies. The NOGO-cargetting nucleic acid may be u Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and (CVA, stroke), Alzhaimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), parkinson's disease, ataxia, Huntington's disease, creuzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression.            NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), parkinson's disease, ataxia, Huntington's disease, creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present

```

The invention relates to a nucleic acid molecule which down regulates expression of a cD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGOD). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids an Inozyme of an ENA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with an NCH worlf), a G-cleaver (cleaving RNA with an NCH worlf) properties an NCH motif) properties an NCH motif) and a g-cleaver (cleaving RNA with an NGN motif) properties an imperzyme (cleaving RNA with an NGN with an NGN with a reduce CD20 in the presence of a divalent cation that is preferably MG<sup>2</sup> +. Furthermore, it may be contacted with a call to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more treat lymphoma, leukaemia, HCD20 targetting nucleic acid may be used to cleave RNA. Immunocytopaemia, and inflammatory arthropathy. The NOGO- immune thrombocytopaemia, and inflammatory arthropathy. The NOGO- immune thrombocytopaemia, and inflammatory arthropathy. The NOGO exergetting nucleic acid may be contacted with a cell to reduce NOGO gene in the presence of a divalent cation that is preferably MG<sup>2</sup> +. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO gene in the presence of a divalent cation that is preferably MG<sup>2</sup> +. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the nucleic acid may be contacted with a cell to reduce NOGO serivity of the nucleic acid may be used to cleave RNA of the NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used to therapies. In particular, whuting a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies. In particular, which amyotrophic lateral sclerosis (MS), chemotherapy-induced neuropathy, and/cleaved di ö Gaps Human, Grb2-related with Insert Domain, GRID, T-cell; co-stimulatory adaptor protein; tissue rejection; graft rejection; leukaemia; cytostatic; ss.
